This monograph contains an exposition of the theory of minimal surfaces in Euclidean space, with an emphasis on complete minimal surfaces of finite total curvature. Our exposition is based upon the philosophy that the study of finite total curvature complete minimal surfaces in R^3 , in large measure, coincides with the study of meromorphic functions and linear series on compact Riemann surfaces. This philosophy is first indicated in the fundamental theorem of Chern and Osserman: A complete minimal surface M immersed in R^3 is of finite total curvature if and only if M with its induced conformal structure is conformally equivalent to a compact Riemann surface M_g punctured at a finite set E of points and the tangential Gauss map extends to a holomorphic map $M_g \rightarrow P^2$. Thus a finite total curvature complete minimal surface in R^3 gives rise to a plane algebraic curve. Let M_g denote a fixed but otherwise arbitrary compact Riemann surface of genus g . A positive integer r is called a puncture number for M_g if M_g can be conformally immersed into R^3 as a complete finite total curvature minimal surface with exactly r punctures; the set of all puncture numbers for M_g is denoted by $P(M_g)$. For example, Jorge and Meeks [JM] showed, by constructing an example g for each r , that every positive integer r is a puncture number for the Riemann surface pl .
